

System for Integrated Modeling of the Atmosphere (SIMA)

January 8, 2020

A. Gettelman, B. Skamarock, M. Barth, H. Liu
SIMA Leadership Group

System for Integrated Modeling-Atmosphere (SIMA)

SIMA is composed of common atmospheric model components & infrastructure

SIMA Frontier Applications

- Coupled Weather
- Climate Extremes
- Space Weather
- Air Pollution
- Coupled Polar

SIMA Vision

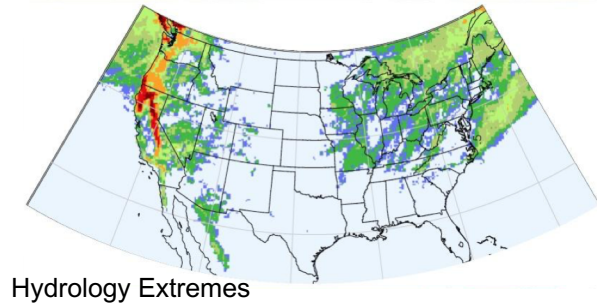

- Encompass Climate, Weather, Chemistry & Geospace
- Prediction (Initialized and Forecast) capabilities
- Complement & extend existing applications (CESM/WRF/MPAS)
- Shared infrastructure for efficiency
- Common atmospheric components (dynamics, physics)
- Includes education, observations, evaluation, computation

Frontier Science Goals

Map to specific applications

- Coupled Simulations at the Weather Scale
 - Tropical cyclones, Extreme convection
- Extreme weather under climate change
 - Extreme heat and precipitation, Hydrologic cycle extremes
- Polar Processes and Prediction
- Integrated Geospace modeling
- Regional/Urban Air Quality

Tropical Cyclones

Air Quality

Space Weather

Current Efforts and Short-term Plans

- Create a version 0 of SIMA (proof of concept)
 - Details in final slide
- Engage entire* community at workshop
 - 2-day workshop during 2-6 March week
 - Expect ~80 people, invitations and applications
 - Goal: Define SIMA effort for Weather, Climate, Geospace, and Chemistry applications
- Develop SIMA version 1
 - Refine SIMA v1 definition based on outcomes of workshop
 - Aim to have SIMA v1 by end of 2020

*Weather, Climate, Geospace, and Chemistry communities

SIMA v0 Progress (goal to have v0 ready for workshop)

(Status)

- Common infrastructure
 - Common Physics Framework (CPF) initial version available
 - Suite of WRF physics parameterization becoming compliant with CPF (nearly done)
 - MICM code is compliant with current version of CPF
- Common Dynamical cores
 - MPAS dynamical core in CAM → non-hydrostatic dynamics and ability to couple with ocean model for tropical cyclone studies (Done; testing simple cases; address scaling issues)
- Releasing CAM SE regionally-refined grid meshes for CONUS and Polar regions to community
- Unified Chemistry (MICM/MUSICA)
 - Full tropospheric chemistry mechanism with CPF compliant code (MusicBox)
 - Test of MICM code in CAM without use of CPF (In progress)
 - CAM-Chem SE with regional refinement mature simulations (2013, forecasts) (Simulations complete; forecasts will occur once emissions are updated)
- Regridding scheme to connect atmosphere grid to ionosphere grid (Done; modify DyCore next)

Extras

SIMA v0 – all items

- Weather
 - Suite of WRF physics parameterization becoming compliant with CPF
 - MPAS dynamical core in CAM – conduct null core test
 - Update CAM-MPAS to v7.0 MPAS
- Climate
 - Release CAM SE with regionally refined grid meshes for CONUS and Polar regions
 - Conduct CAM-MPAS (non-hydrostatic) for idealized cases
 - Test CPF in a simple model
 - Produce a prototype of CAM running with CPF
- Geospace
 - Regridding scheme to connect atmosphere grid to ionosphere grid
 - High resolution ionospheric modules using WACCM-X
 - Modify SE dynamical core for thermosphere

SIMA v0 – continued

- Chemistry

- CAM-Chem SE with regional refinement mature simulations (2013, forecasts)
- Full tropospheric chemistry mechanism with CPF compliant code (MusicBox)
- Test of MICM code in CAM without use of CPF
- Offline emission tool released to the community for regionally-refined grids
- Translator for KPP files to JSON format (will provide guidance only because each mechanism contains its own unique set of KPP description)

- Produce CAM SE version that is well tuned
- Produce WACCM SE updating gravity wave parameterization and QBO
- Produce SE RR emissions over CONUS
- Evaluation of CAM-Chem SE RR runs with monitoring stations, aircraft field experiments, and satellite data as well as WRF simulations
